The Swissmed Cancer Protocol™

Personalized cancer treatment
that can make the difference.

www.swissmedhealth.com

Live your life to the fullest without disease or aging getting in your way

Introduction

Personalized cancer treatment has been empowering patients to fight cancer and live longer. By artfully combining the most innovative developments in genetic testing, immunotherapy, functional medicine and biological medicine, our Swiss Cancer Protocol delivers personalized cancer care to patients from all over the world.

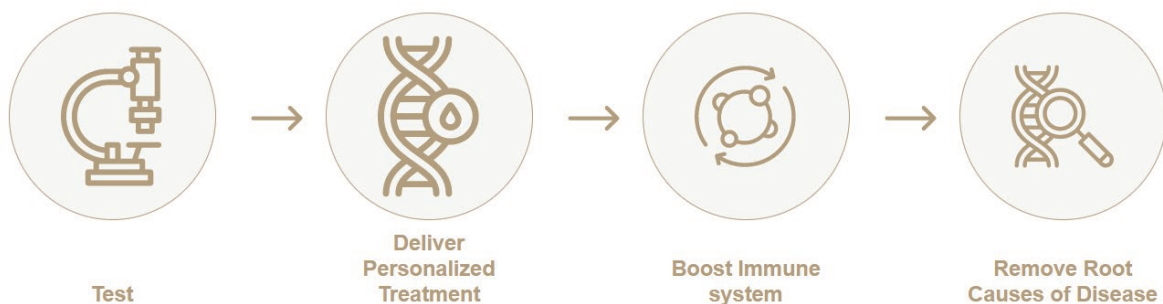

Conventional cancer treatments use a “brute force” approach, with most patients getting the same treatment, be it radiation, chemotherapy, or drugs.

Contrary to the conventional approach, personalized cancer care uses tumor marker testing and custom tailors a treatment to each patient.

No two treatments plans are the same and the results can be very encouraging. According to a 2022 study published in the In Vivo Journal cancer patients who received personalized cancer care showed benefits in 77% of cases.

The Swiss Cancer Protocol at SwissMed Health consists of four steps:

- Test Cancer Markers
- Plan and Deliver Personalized Treatment
- Boost Immune System
- Remove Root Causes of Disease

When cancer patients come to us, we first define their therapeutic goals and then we customize the four steps to accomplish those goals. Each patient is different, and, with few exceptions, there are no one-size-fits-all solutions.

Whereas this report is by no means an exhaustive discourse on cancer, the following pages summarize our four-step approach to personalized cancer therapy.

If you or someone who know is dealing with cancer, we encourage to contact us for more details.

TUMOR MARKER TEST

Test Cancer Markers

Cancer patients often experience undesirable side effects such as hair loss, tiredness, feeling sick, destruction of healthy cells and more.

While attacking cancer cells, the Swiss Cancer Protocol works alongside your body and immune system-not against them. And this is the reason why we begin the process with comprehensive testing based on each patient's genetic markers.

By examining the patient's decoded genetic markers, the treating physician will deliver the most personalized and effective treatment, which is literally based on what the patient's body says.

Put differently, the tests provide targeted information about what medical treatments and natural remedies might be best suited to your genetic predispositions and type of cancer.

This stunning precision care is the inevitable future of medicine. At SwissMed Health you can be part of the future today with the Swiss Cancer Protocol.

Deliver Personalized Treatment

Following an evaluation of the tests and the selection of the cancer treatments your genetic markers say are better for you than others, your healing journey will begin.

Cancer cells are intelligent and not easy to eliminate. Like all organisms, they want to survive and grow, and, as a result, they try to adapt to toxic environments that seek to destroy them. This is the reason why the Swiss Cancer Protocol combines biological medicine, integrative medicine, immunotherapy and other innovative therapies to fight cancer.

The goal is always to deliver cancer treatments as well as other supportive treatments with the highest chances of success. What's more, we want to not only protect your normal healthy cells, but also to strengthen them, as they also play a role in the healing process.

Following are a few examples to further elucidate the nature of personalized cancer care.

Personalized Natural Treatments

American actress Suzanne Sommers brought wide recognition to mistletoe injections as an alternative treatment for cancer. And so, a cancer patient may read her book and decide that injecting their body with mistletoe might help them.

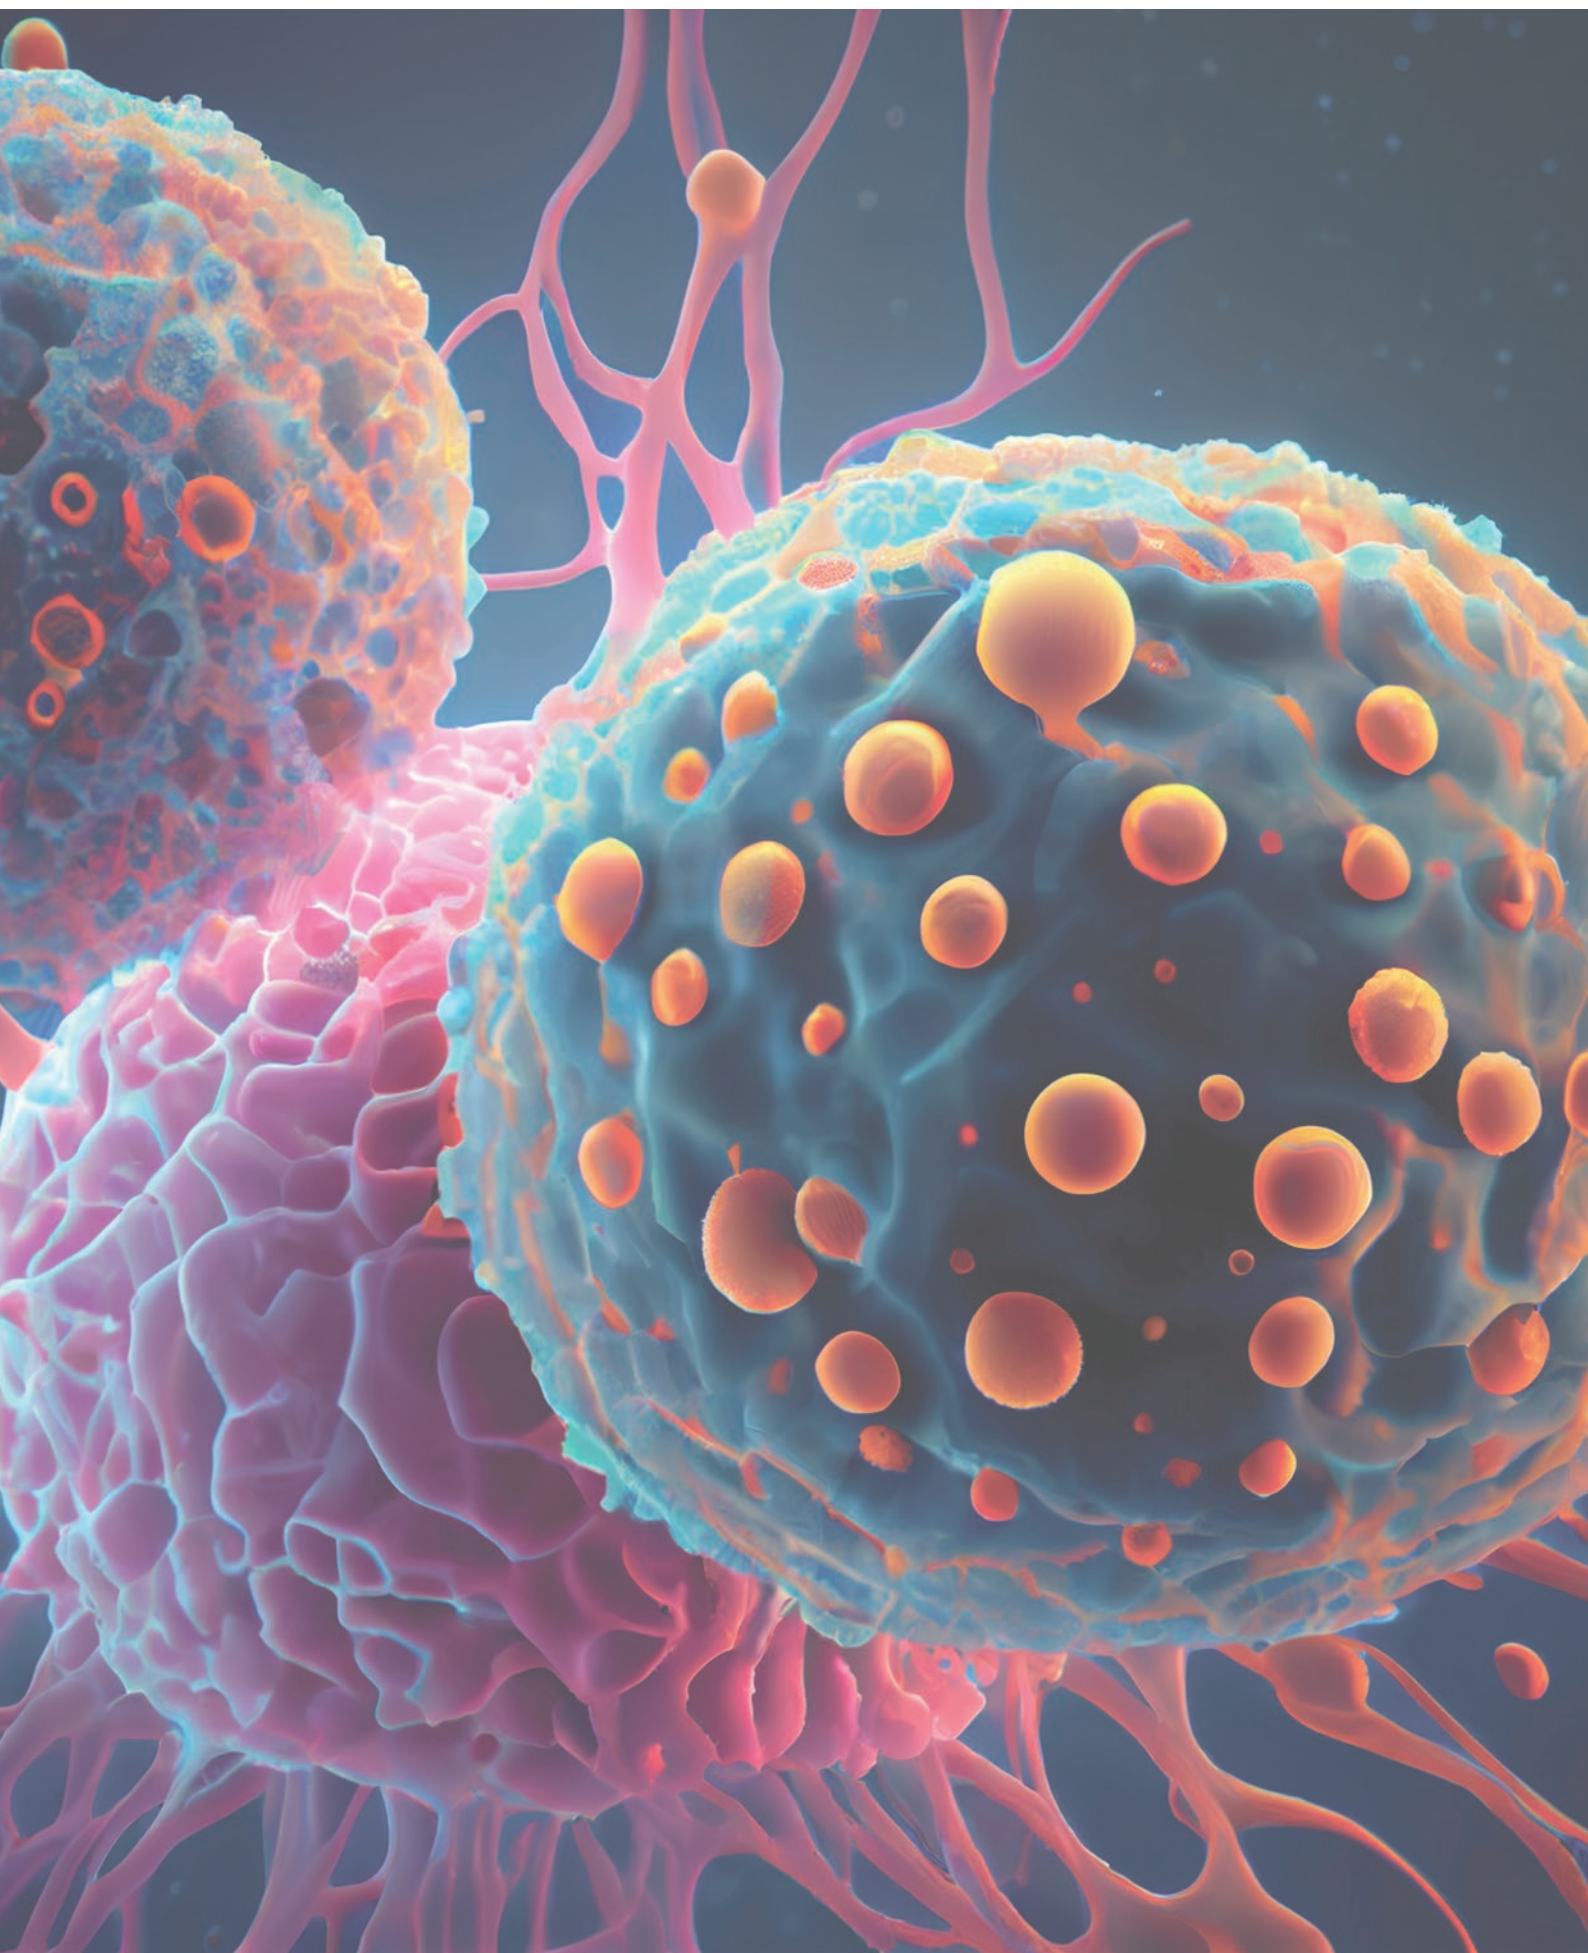

Again, this is another “brute force” generic approach, similar to standard chemotherapy. Injecting mistletoe may help the cancer patient, or it may deliver no results. Not to mention the lost time and resources. It’s simply guessing.

With cancer marker testing, there is no more guessing. Nor do you have to place your trust on celebrities, books or questionable Internet sources. With cancer marker testing, you and your doctor will know exactly which natural treatments will have most impact and by what percentage.

The tests screen for over 30 natural treatments, including indol 3 carbinol, melatonin, genistein, curcumin and many more.

Patients often come to SwissMed Health with certain natural “sacred cows,” high-dose Vitamin C IVs being one of them. Very often they are surprised and even shocked when they learn that their favorite natural treatment will have little to no effect on their disease. Such are the twists and turns of the healing journey to freedom from cancer.

Dendritic Cell Vaccine

A dendritic cell vaccine contains dendritic cells loaded with antigen, such as tumor-associated antigen. The first step in the process of creating this personalized vaccine is to draw a blood sample from the patient. Then, the blood sample is processed at the lab, whereby monocytes are isolated and cultured to generate dendritic cells. The dendritic cell vaccine is then injected back into the patient's body where it induces an antigen-specific T-cell response against the cancer tumor.

In short, a dendritic cell vaccine stimulates your immune system and empowers it to destroy more cancer cells.

In more scientific language, dendritic cells are activated in vitro against specific peptides and then administered back to the same patient in order to activate both CD8+ and CD4+ cells against these specific peptides. As a result, the immune system is stimulated and creates an antitumor response.

This process is a form of immunotherapy and is a key part of the Swiss Cancer Protocol. What's more, being a personalized therapy, dendritic cell vaccination has no side-effects. Your doctor will explain in detail how dendritic cell immunotherapy works or you can contact us now for more information.

Oligonucleotide Therapy

Oligonucleotide therapy is an advanced form of personalized cancer care. Again, blood is drawn from the patient, a personalized treatment is created at the lab and then is injected back to the body of the patient. Acting as a “shutoff key” that fits into the “lock” of cancer cells, this personalized treatment disrupts the survival of cancer cells, preventing them from growing or spreading.

In more scientific language, the circulating tumor cells are analyzed and then a small molecule of micro-RNA is developed in the lab to inhibit the part of cancer cell that controls its gene replication. As a result, apoptosis or cell death of cancer cells takes place because they cannot replicate.

Oligonucleotide therapy is neither gene therapy, nor a drug. It is an advanced custom-tailored approach to cancer. And because it uses the patient’s own cells, it does not appear to have side effects.

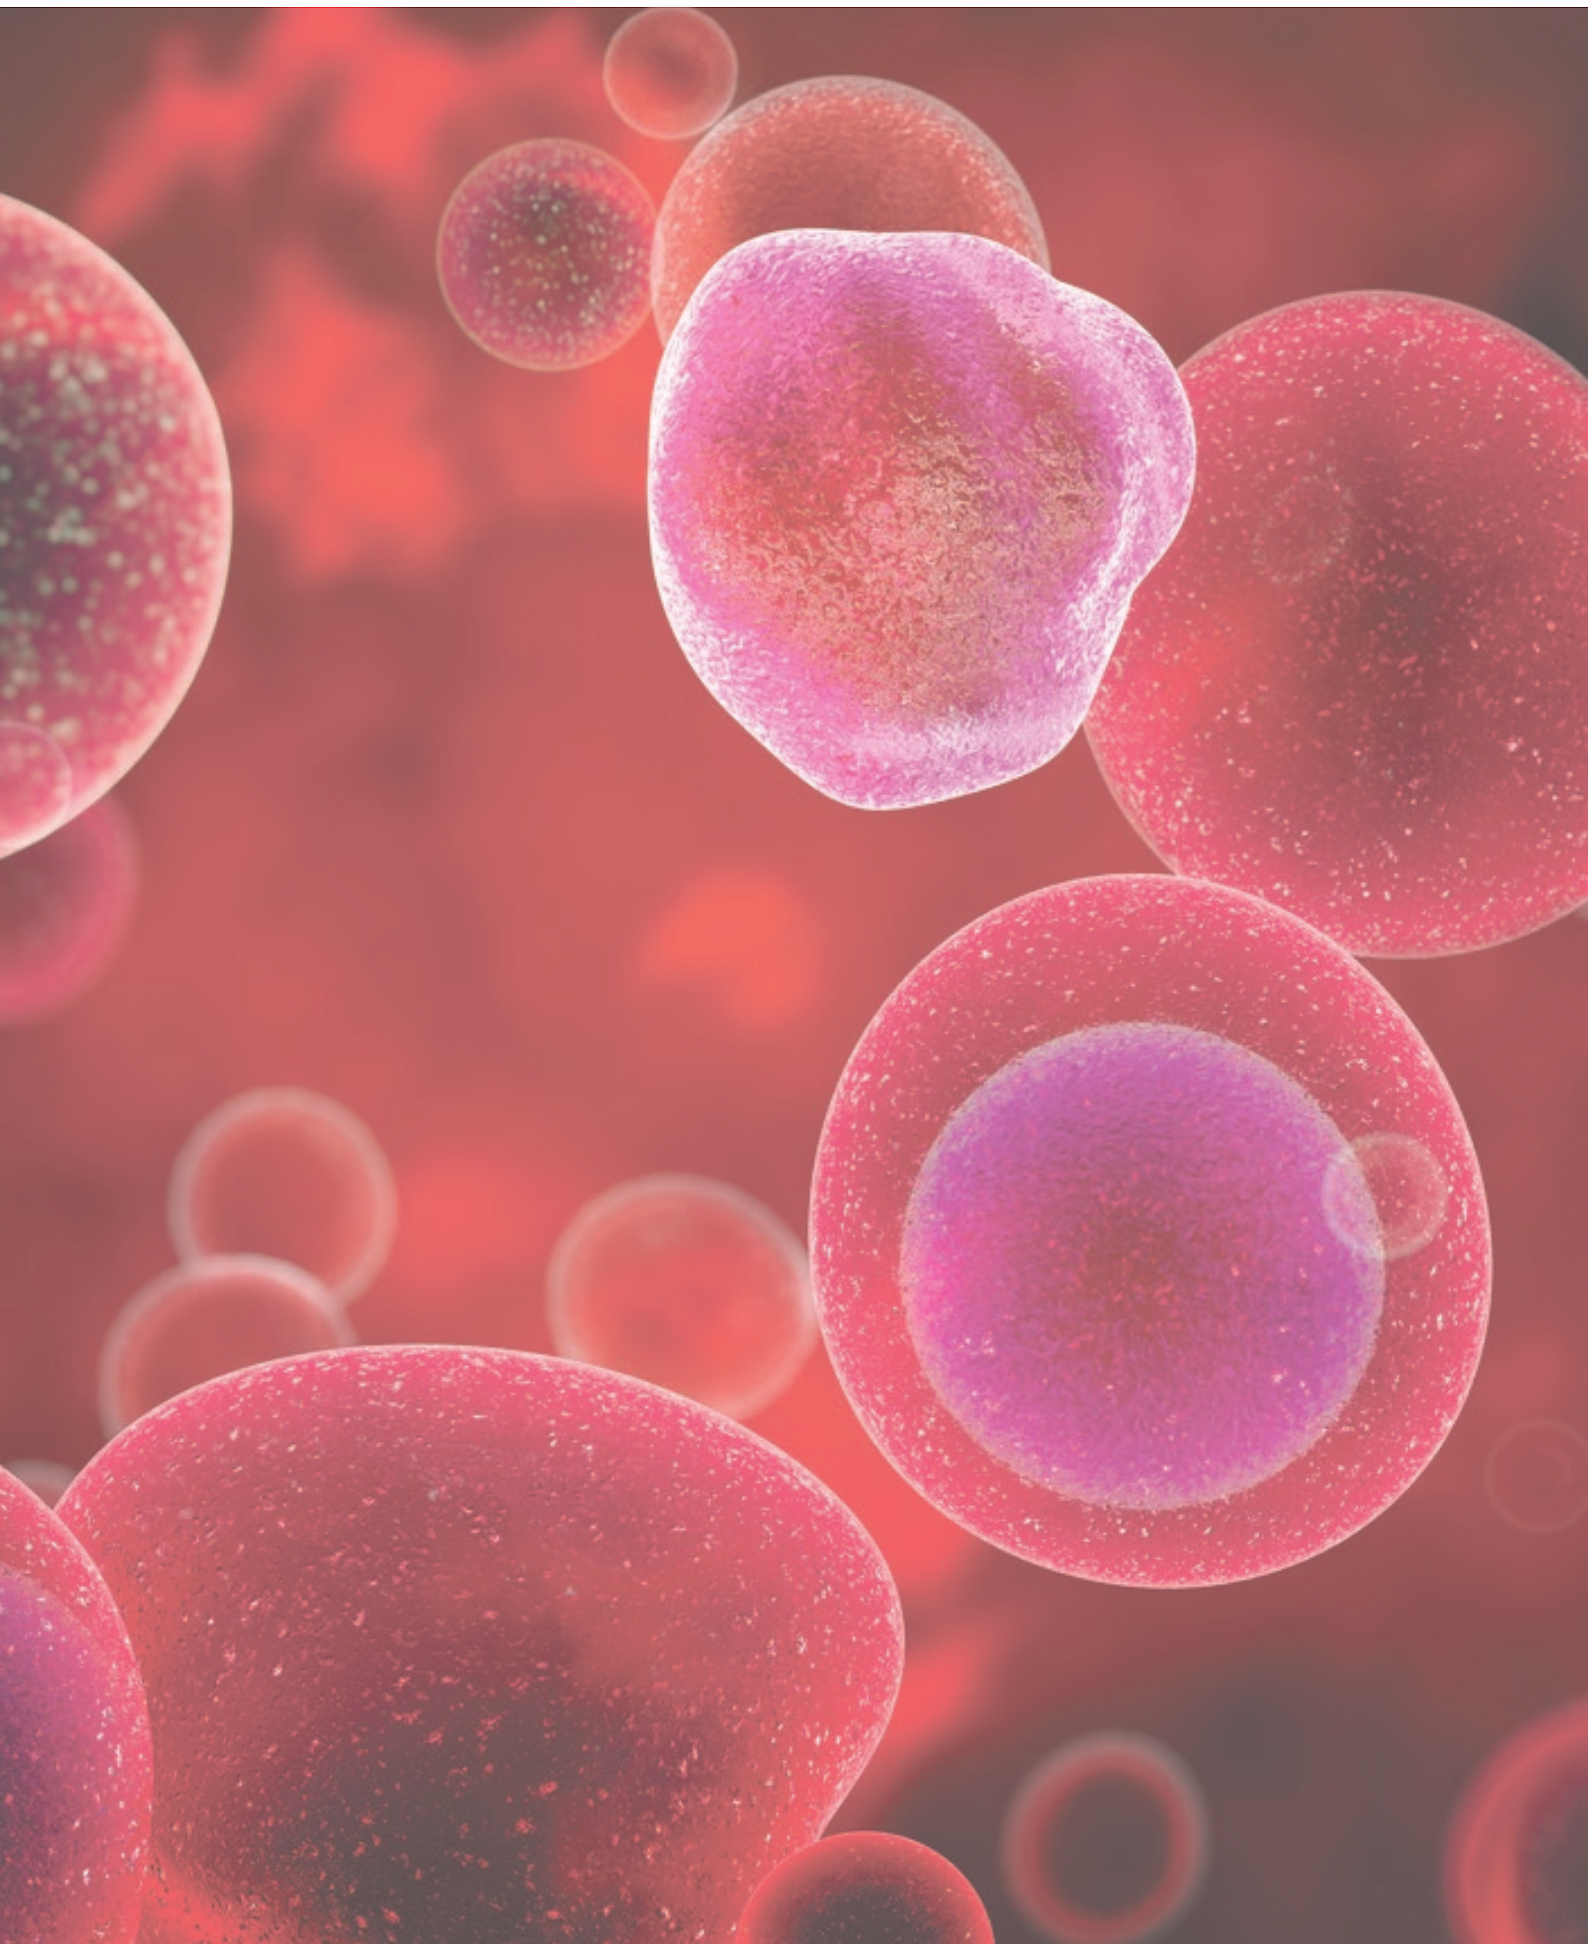

According to a study by one of our personalized-medicine partners, some cancers seemed to respond better to this therapy.

- Patients with leukemia had a 100% response
- Patients with prostate cancer a 95.00% response
- Patients with colorectal cancer a 88.00% response, and
- Patients with breast cancer a 81.00% response

Again, the SwissMed Health offers personalized cancer care that is unique to you and your body’s genetic makeup. And even though results may vary, that is why this protocol is different and can often work.

As you go through your custom-tailored Swiss Cancer Protocol, our doctors will monitor and discuss your progress, making the necessary adjustments and modifications on the way to ensure the best possible outcome. Please, feel free to contact us at any time with any questions you may have.

Boost the Immune System

The National Cancer Institute of the United States defines the immune system as “a complex network of cells, tissues, organs, and the substances they make that helps the body fight infections and other diseases. The immune system includes white blood cells and organs and tissues of the lymph system.”

The immune system is important to people who have cancer for three reasons:

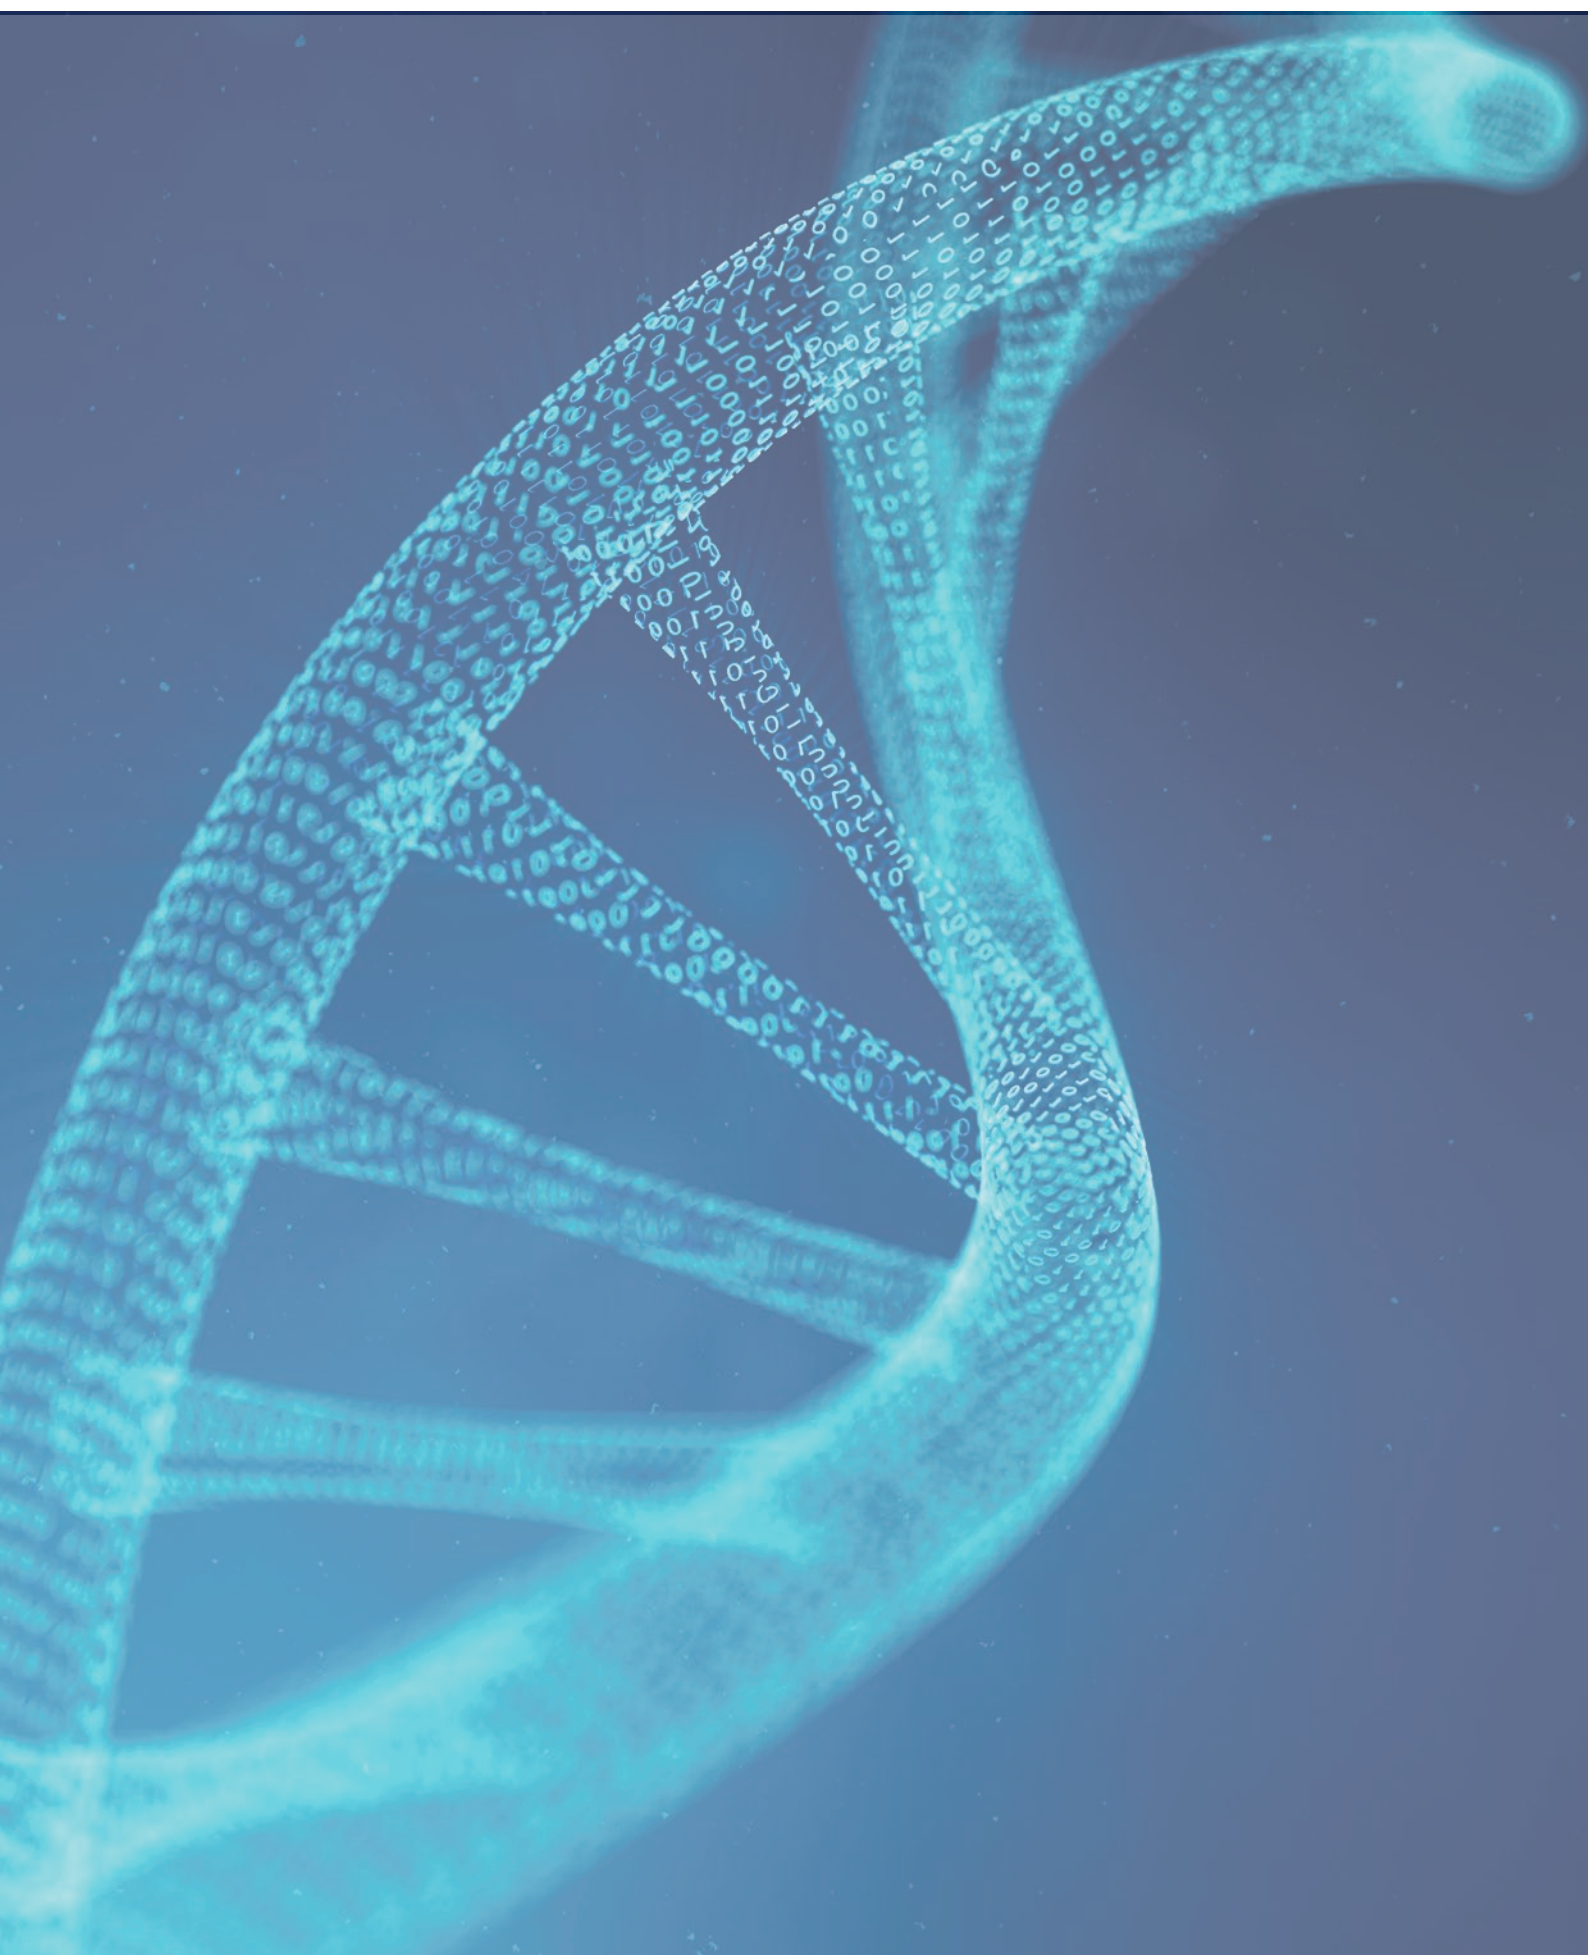

- Cancer itself as well as generic cancer treatments can weaken the immune system,
- The immune system is important in defeating cancer, and
- A strong immune system is necessary to ward off other diseases while dealing with cancer.

In addition to the dendritic cell vaccine that empowers the immune system to kill cancer cells, we have more treatments to help boost your immune response. These include:

- Ozone therapy
- Dental therapy
- IV infusions
- Magnetic field therapy
- Sanum therapy
- Acupuncture, and more.

Your doctor will discuss with you these immune system support treatments and choose which ones are suited to your cancer care.

Remove Root Causes of Disease

At SwissMed Health, we understand that no disease, including cancer, functions in isolation. In most cases, patients have systemic medical conditions that undermine their wellness and health.

These conditions include:

- Heavy-metal toxicity
- Gut dysbiosis
- Chronic inflammation
- Stress
- Hormonal imbalance
- Vitamin depletion
- Acidity
- Parasitic and fungal infections
- Emotional trauma and more

Some of the available treatments that contribute to removing the roots of disease include:

- EDTA and DMPS IV infusions (chelation therapy)
- Alkaline infusions
- Autonomic nervous system analysis
- Neural therapy
- Gut rehabilitation
- Inflammation reduction
- Glutathione IV
- Bio-resonance
- Colon hydrotherapy
- Mesotherapy and more

Whereas it is not absolutely necessary to work on these systemic root causes of disease while undergoing the personalized cancer treatments, it is highly recommended that you do so. This is a decision between you and your doctor.

Next Steps

At SwissMed Health we truly care about you, our patient, and we take our responsibility to deliver medical care tailored to your needs very seriously.

To us you are not a faceless patient—you are an individual. Which means we will give you the personal attention, dignity, and respect you deserve.

Whatever stage your cancer is, the sooner you start the better. Our Swiss Cancer Protocol will be modified and personalized in accordance with your genetic markers and tumor type to ensure you get the best chance for a successful outcome.

Finally, we encourage you to contact us at your earliest convenience so we can answer your questions and explain in greater detail how we can help you.

And remember: with personalized cancer treatments there's hope.

About Swissmed Health

Swissmed Health is an innovative medical center located in Cyprus. We offer patients a new approach to health called *personalized Swiss medicine*. Developed after working with over 22,000 patients, our approach synergistically combines the best of functional medicine, biological medicine and personalized medicine. By seamlessly integrating cutting-edge diagnostics, compassionate care and innovative treatments, we not only enhance the quality of life but also inspire a profound sense of hope and confidence in our patients and community.

Through our visionary personalized medicine approach, we strive to eradicate health limitations, enabling a stress-free and pain-free lifestyle for patients, so they can lead a life of vitality and well-being. Drawing inspiration from the belief that life should be lived to its fullest, we relentlessly pursue excellence in healthcare. Our legacy is one of authentic, personalized solutions for even the most complex conditions.

Rooted in Swiss values of precision and trust, Swissmed Health stands as a beacon of hope for patients who run out of options. We are devoted to nurturing wellness and empowering patients to take control of their lives through seamless experiences and exceptional care.

As we embrace our legacy, we are committed to not only enhancing the healthcare system but also becoming the model for a truly integrated, compassionate, and visionary healthcare approach. Welcome to Swissmed Health, where we don't just care for life—we catalyze its brilliance.

Our Philosophy

Personalized Swiss medicine differs from conventional medicine in several ways. It focuses on identifying and addressing the underlying root causes of disease rather than just treating symptoms. It also emphasizes the interconnectedness of the body's systems and the importance of addressing underlying imbalances.

What's more, personalized Swiss medicine takes a more holistic, patient-centered approach to care, recognizing that every individual is unique and requires personalized attention. Through a highly customized approach to care, our medical doctors aim to optimize patients' health and wellness, using a combination of sophisticated testing, innovative, evidence-based therapies, holistic treatments as well as lifestyle modifications. Following are some of the key principles of our philosophy:

- 1 *The body is a complex, interconnected system*
- 2 *Each patient is unique*
- 3 *Health is more than the absence of disease*
- 4 *The body has an innate ability to heal*
- 5 *Nutrition is important*
- 6 *Mind-body connection*
- 7 *Lifestyle factors matter*
- 8 *Prevention is key*
- 9 *Collaboration with the patient is essential*
- 10 *Evidence-based care*
